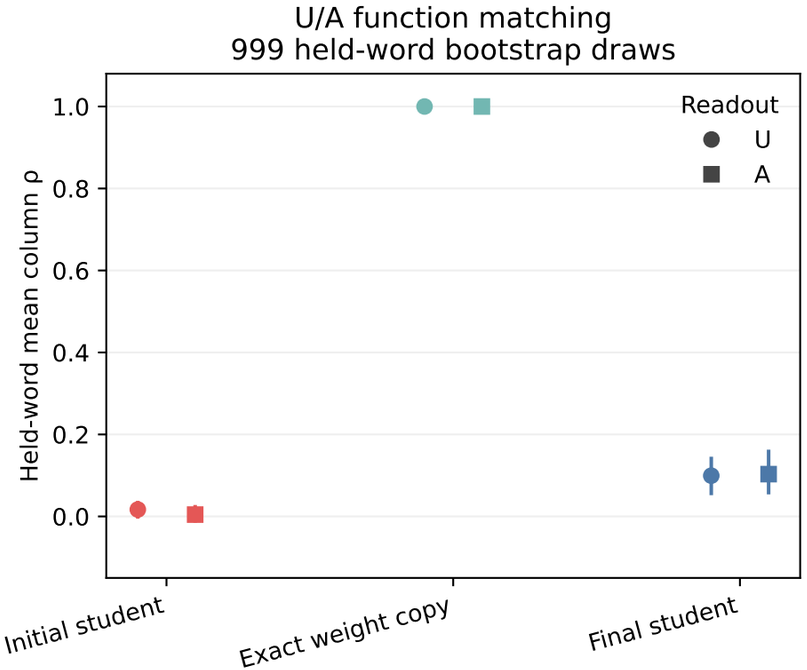
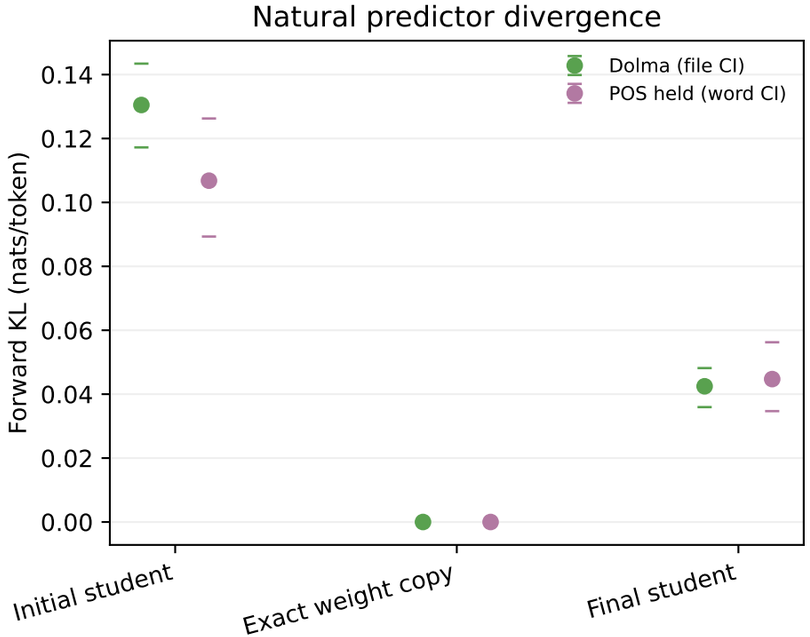
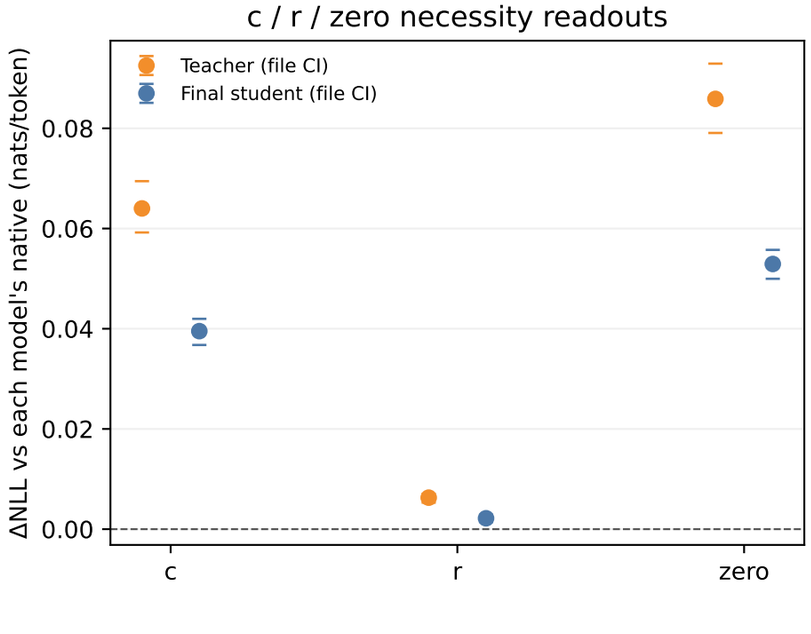
E135 — Functional and predictor readouts







One native teacher and one trained student; intervals describe held-word or file-level measurement uncertainty, not seed variation. Dolma: BF16 logits → FP32 log-softmax. POS: BF16 backbone → genuine FP32 last-position vocabulary head/log-softmax. Exact weight copy stores the original BF16-valued weights in FP32. Remaining discrepancies are shown directly; no equivalence threshold or knowledge fraction is implied.
