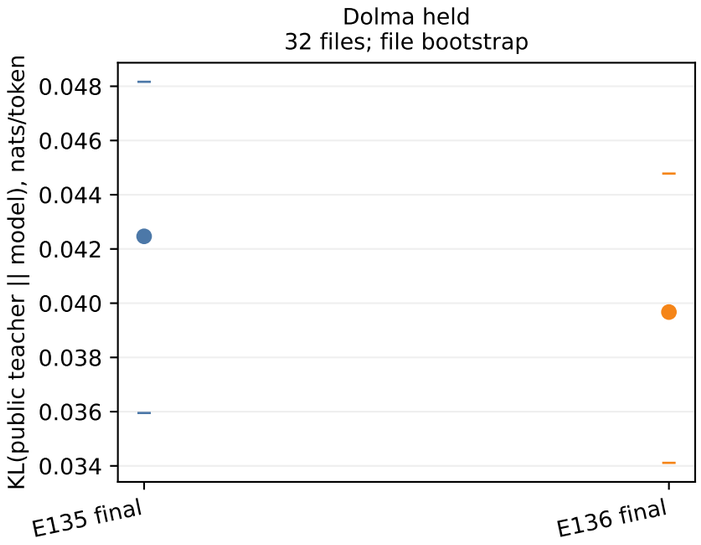
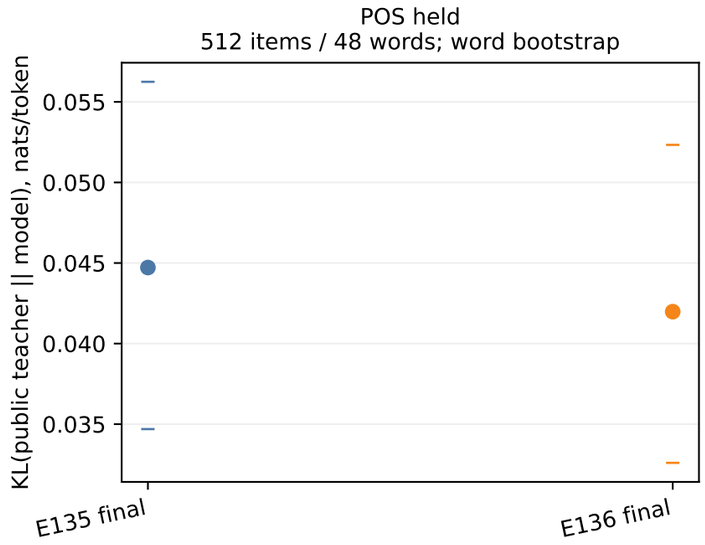
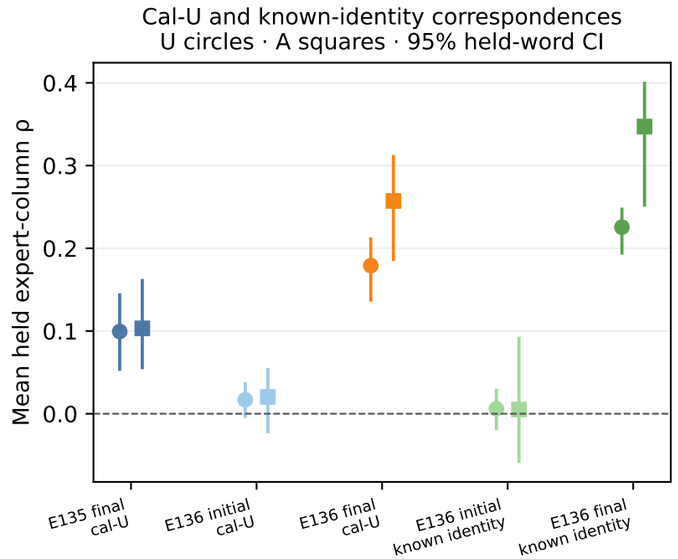
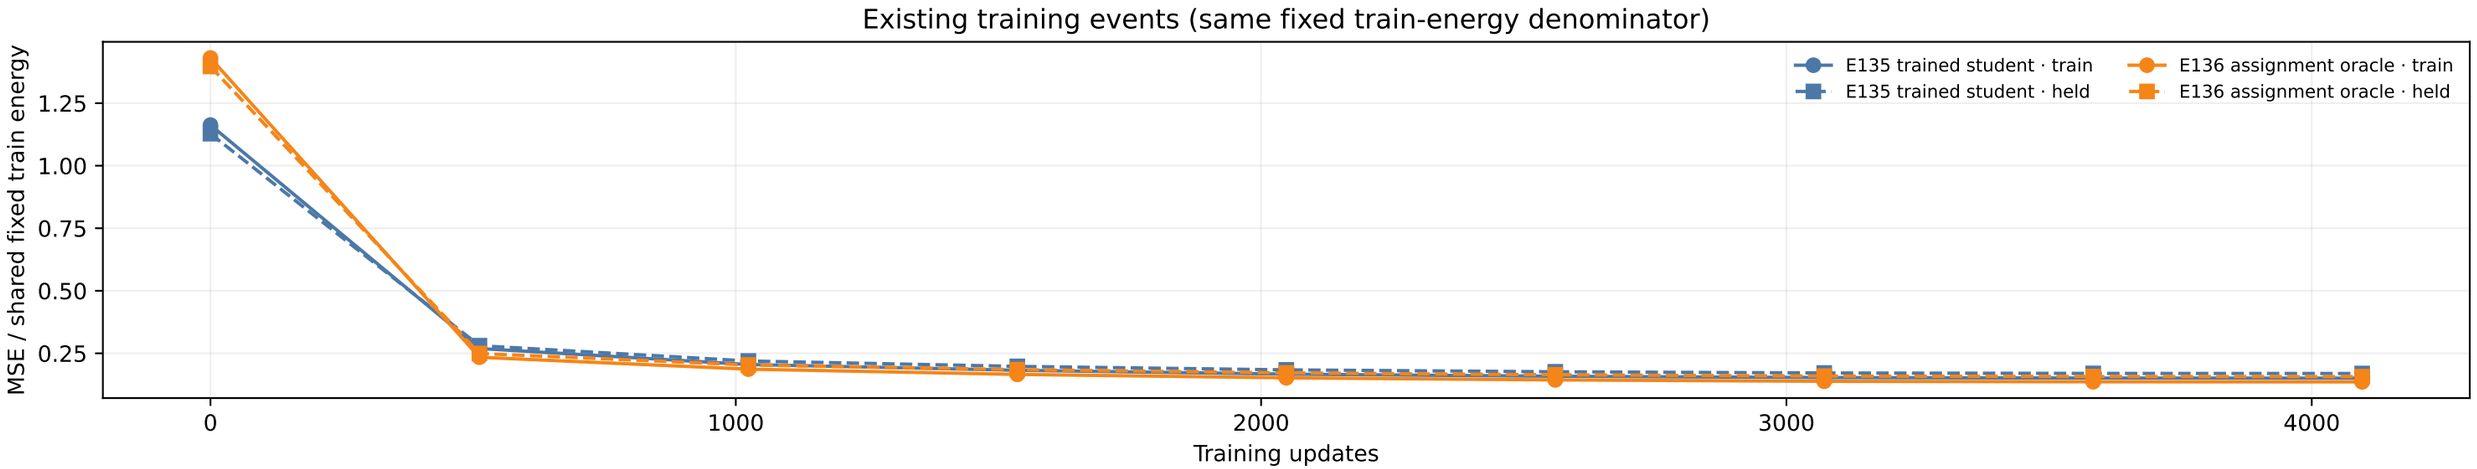
E135 student and E136 assignment-oracle readouts









q is the public teacher in predictor readouts. Precision: Dolma BF16 logits → FP32 log-softmax; POS BF16 backbone → genuine FP32 last-position vocabulary head/log-softmax. Dolma intervals are file-level; POS and function intervals are held-word measurement uncertainty, not seed uncertainty. Known identity is shown as a separately predesignated correspondence; E136 initial A is included as a baseline. One teacher/student per condition; no unique-role or knowledge-fraction claim. Held MSE uses the shared train-energy denominator, not held energy.
