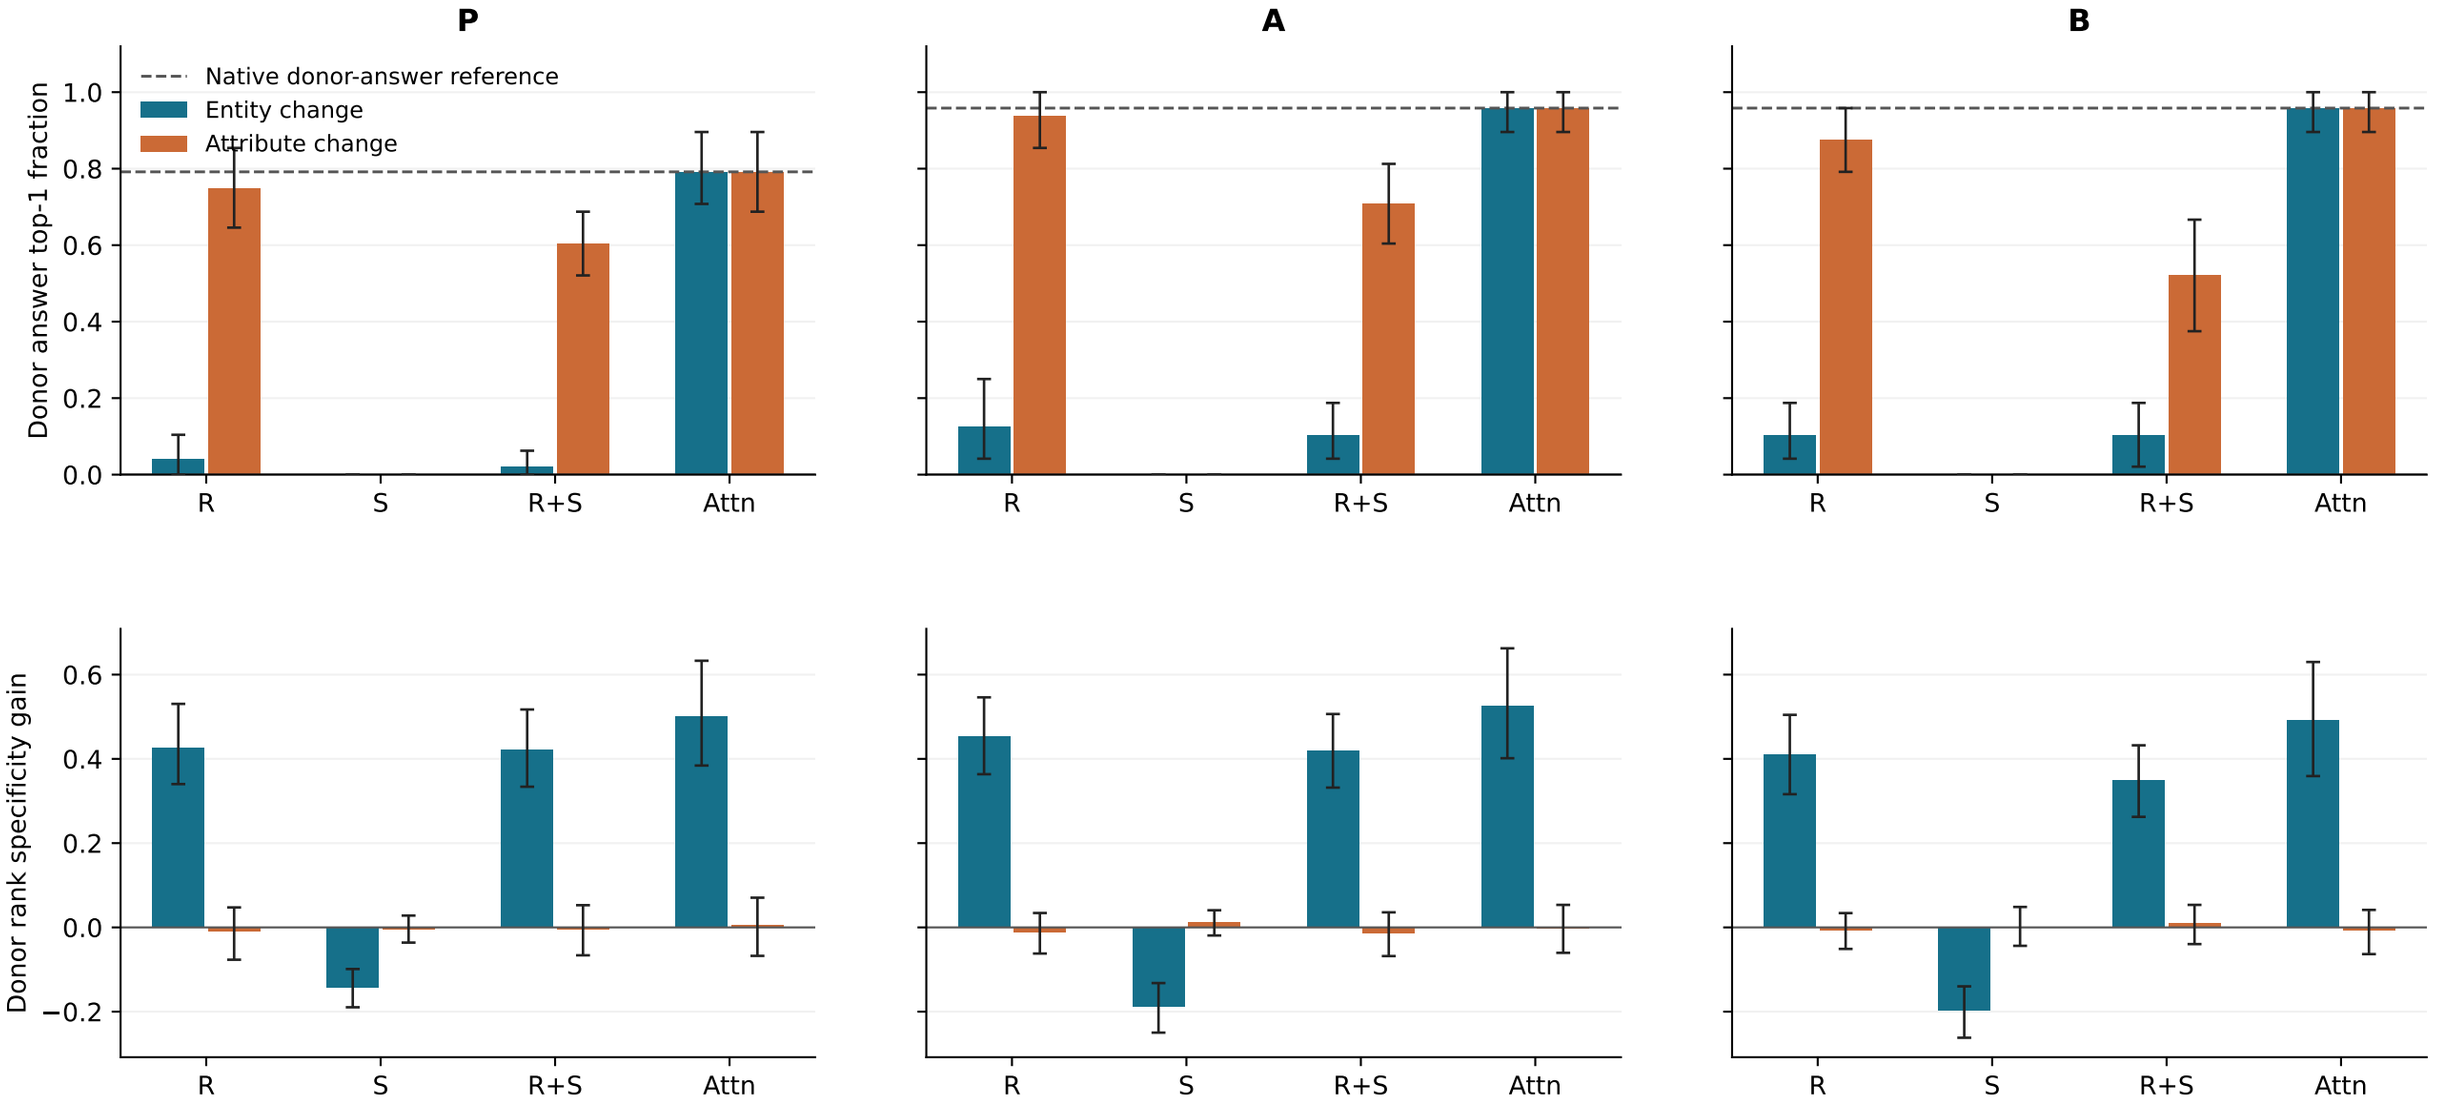
Whole-path interchange: donor answers and rank specificity



POST-HOC readout diagnostic: native unasked-answer within-relation win fractions 0.988–1.000; ranking may already be near ceiling. Original metrics unchanged.
First canonical answer token; whole terminal position across 16 layers, earlier decoder prefix fixed; nonreplaced paths endogenous.
24 countries × 2 relations; equal-relation macro, paired country 95% CI (not seed uncertainty). Dashed line is a reference, not an upper bound.
