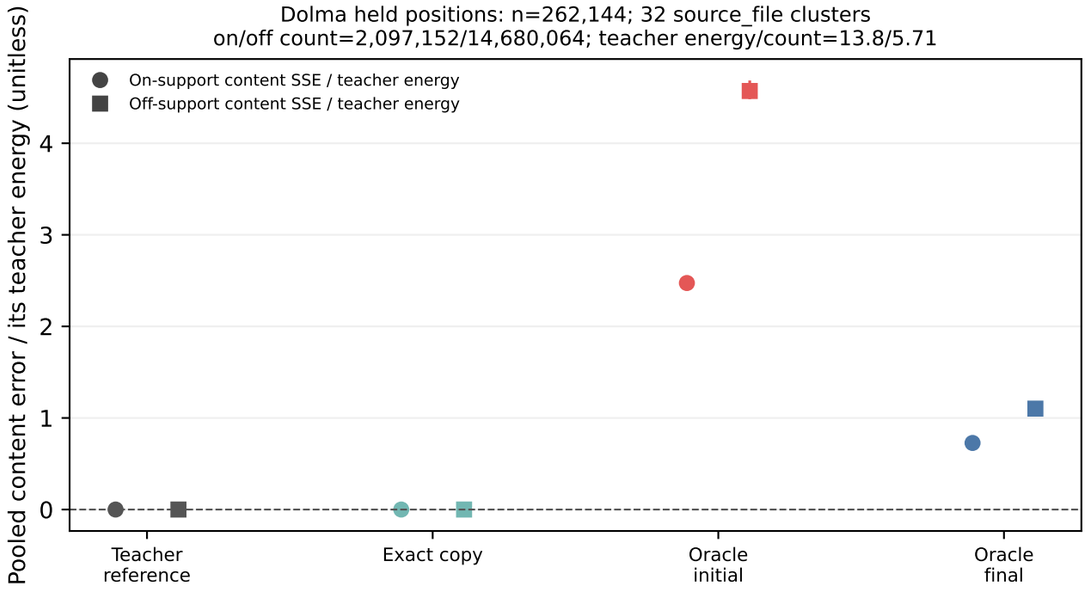
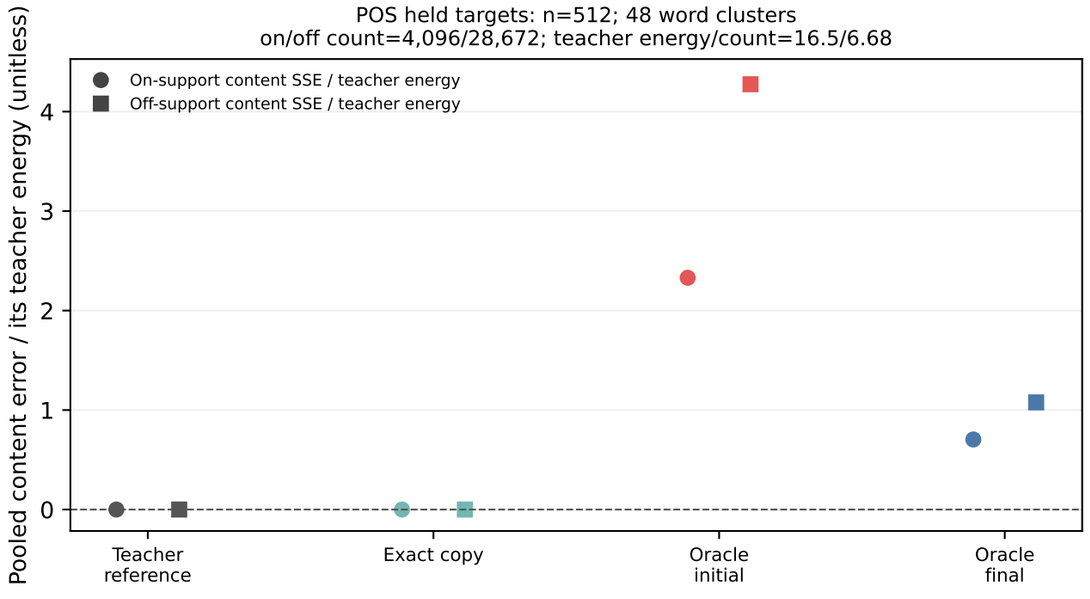
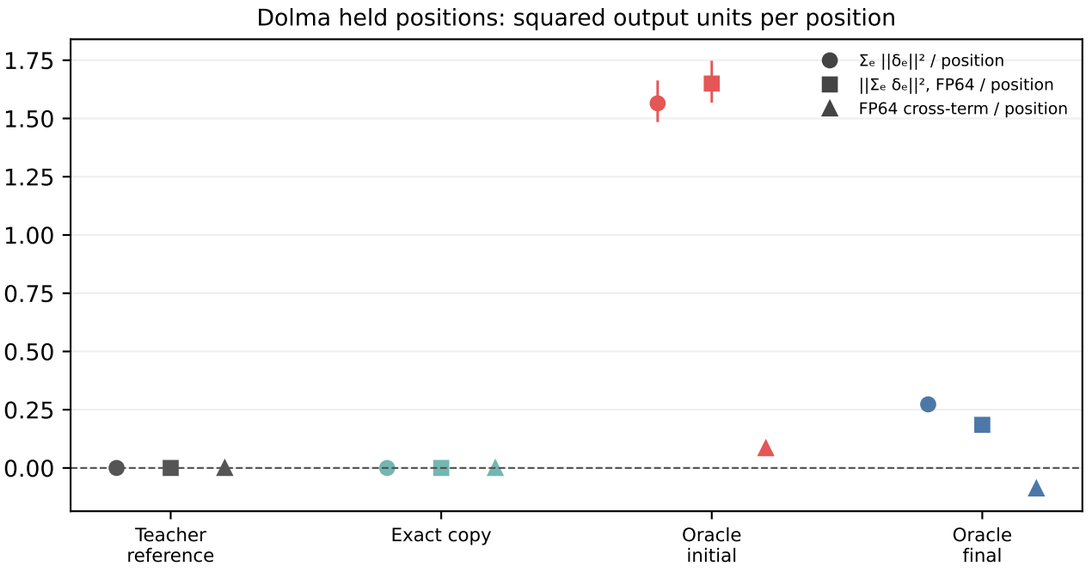
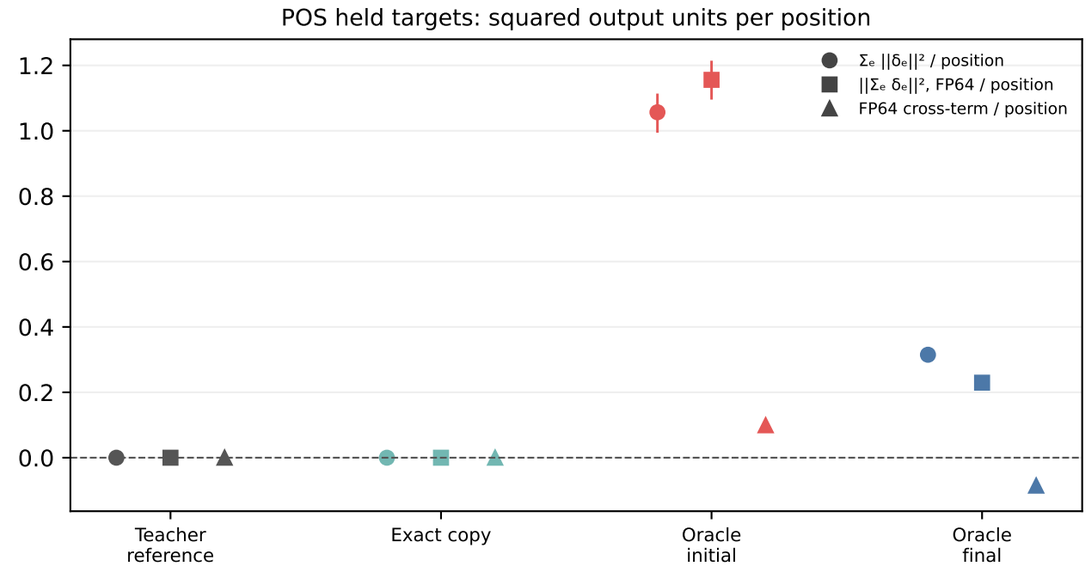
E137 — Native-support component error and aggregation









Intervals resample input clusters (Dolma source files; POS words), not seeds. Teacher is an exact identity reference; copy is measured. POS experts 42,51,52 have on_count=0 and remain included. POS values pool 512 targets; they are not equal-word averages or prior KL/NLL. Cross-term is the FP64 aggregate-minus-component covariance identity in matching squared-output units/position, not semantic collaboration. Native aggregate/product/shape rounding floors and FP32−FP64 sum residual are separate columns in readout_table.json.
